Objetivos de aprendizagem (conhecimentos, aptidões e competências)

- Solve a flow problem on a simple geometry using commonly used numerical techniques
- Select appropriate data from open source databases to support modeling setup and evaluation
- Create hydrodynamic and morphodynamic models using state-of-the-art systems in a practical situation
- Construct boundary conditions using input reduction and schematisation techniques for simulation speedup
- Build and execute the appropriate model setup for a given problem
- Critically evaluate the results of complex models
- Translate model results into practical outcomes and communicate them to stakeholders

Conteúdos programáticos

- Introduction to numerical methods for hydrodynamical modelling
 - Data sources for modelling: tides, waves, winds, bathymetry
 - Regional modelling of tides, waves and surge with Delft3D
 - Compound flood and erosional hazard modelling with SFINCS and XBeach
 - Long term shoreline modeling using Shorelines
 - Group exercise: computing multi-hazards at Beira, Mozambique, for the case of cyclone Idai
-

Metodologias de ensino (avaliação incluída)

The course has 5 ECTS, corresponding to a total of 140 hours of work, distributed over 70 hours of contact and 70 hours of autonomous work. The contact hours are spread over 35 T and 35 TP. Theoretical classes will be based on oral presentations with image support, and include demonstrations of different modelling concepts. The practical sessions allow the students to set up models and analyse the outcomes. Results are presented to their peers in short pitches. The autonomous group work will focus on the analysis and presentation of the hindcast of tropical cyclone Idai in Mozambique.

Summative assessments: Assignment Numerical Methods (25%), Group exercise Idai (75%)

Teaching/Learning modality Face to face

Coordinating teacher Óscar Manuel Fernandes Cerveira Ferreira

Teaching staff	Type	Classes	Hours (*)
----------------	------	---------	-----------

* For classes taught jointly, it is only accounted the workload of one.

Contact hours	T	TP	PL	TC	S	E	OT	O	Total
	35	35	0	0	0	0	0	0	140

T - Theoretical; TP - Theoretical and practical ; PL - Practical and laboratorial; TC - Field Work; S - Seminar; E - Training; OT - Tutorial; O - Other

Pre-requisites

no pre-requisites

Prior knowledge and skills

N/A

The students intended learning outcomes (knowledge, skills and competences)

- Solve a flow problem on a simple geometry using commonly used numerical techniques
- Select appropriate data from open source databases to support modeling setup and evaluation
- Create hydrodynamic and morphodynamic models using state-of-the-art systems in a practical situation
- Construct boundary conditions using input reduction and schematisation techniques for simulation speedup
- Build and execute the appropriate model setup for a given problem
- Critically evaluate the results of complex models
- Translate model results into practical outcomes and communicate them to stakeholders

Syllabus

- Introduction to numerical methods for hydrodynamical modelling
 - Data sources for modelling: tides, waves, winds, bathymetry
 - Regional modelling of tides, waves and surge with Delft3D
 - Compound flood and erosional hazard modelling with SFINCS and XBeach
 - Long term shoreline modeling using Shorelines
 - Group exercise: computing multi-hazards at Beira, Mozambique, for the case of cyclone Idai
-
